0.0.1 Activation Function Implementations:

Implementation of `activations.Linear`:

```
class Linear(Activation):
    def __init__(self):
        super().__init__()

    def forward(self, Z: np.ndarray) -> np.ndarray:
        """Forward pass for f(z) = z.

        Parameters
        ----------
        Z  input pre-activations (any shape)

        Returns
        -------
        f(z) as described above applied elementwise to `Z`
        """
        return Z

    def backward(self, Z: np.ndarray, dY: np.ndarray) -> np.ndarray:
        """Backward pass for f(z) = z.

        Parameters
        ----------
        Z   input to `forward` method
        dY  derivative of loss w.r.t. the output of this layer
            same shape as `Z`

        Returns
        -------
        derivative of loss w.r.t. input of this layer
        """
        return dY
```

Implementation of `activations.Sigmoid`:

```
class Sigmoid(Activation):
    def __init__(self):
```

```python
        super().__init__()

    def forward(self, Z: np.ndarray) -> np.ndarray:
        """Forward pass for sigmoid function:
        f(z) = 1 / (1 + exp(-z))

        Parameters
        ----------
        Z  input pre-activations (any shape)

        Returns
        -------
        f(z) as described above applied elementwise to `Z`
        """
        ### YOUR CODE HERE ###
        return ...

    def backward(self, Z: np.ndarray, dY: np.ndarray) -> np.ndarray:
        """Backward pass for sigmoid.

        Parameters
        ----------
        Z   input to `forward` method
        dY  derivative of loss w.r.t. the output of this layer
            same shape as `Z`

        Returns
        -------
        derivative of loss w.r.t. input of this layer
        """
        ### YOUR CODE HERE ###
        return ...
```

Implementation of `activations.ReLU`:

```python
class ReLU(Activation):
    def __init__(self):
        super().__init__()

    def forward(self, Z: np.ndarray) -> np.ndarray:
        """Forward pass for relu activation:
        f(z) = z if z >= 0
               0 otherwise

        Parameters
        ----------
        Z  input pre-activations (any shape)

        Returns
```

```
        -------
        f(z) as described above applied elementwise to `Z`
        """
        ### YOUR CODE HERE ###
        return np.maximum(0, Z)

    def backward(self, Z: np.ndarray, dY: np.ndarray) -> np.ndarray:
        """Backward pass for relu activation.

        Parameters
        ----------
        Z   input to `forward` method
        dY  derivative of loss w.r.t. the output of this layer
            same shape as `Z`

        Returns
        -------
        derivative of loss w.r.t. input of this layer
        """
        ### YOUR CODE HERE ###
        dY[Z < 0] = 0
        return dY
```

Implementation of `activations.SoftMax`:

```
class SoftMax(Activation):
    def __init__(self):
        super().__init__()

    def forward(self, Z: np.ndarray) -> np.ndarray:
        """Forward pass for softmax activation.
        Hint: The naive implementation might not be numerically stable.

        Parameters
        ----------
        Z  input pre-activations (any shape)

        Returns
        -------
        f(z) as described above applied elementwise to `Z`
        """
        ### YOUR CODE HERE ###

        maxes = np.array(np.max(Z, axis=1))
        maxes = np.reshape(maxes, (np.shape(maxes)[0], 1))

        pre_exponential =  Z - maxes
        post_exponential = np.exp(pre_exponential)
```

```
        sums = np.sum(post_exponential, axis=1)
        sums = np.reshape(sums, (np.shape(sums)[0], 1))

        answer = np.divide(post_exponential, sums)

        return answer

    def backward(self, Z: np.ndarray, dY: np.ndarray) -> np.ndarray:
        """Backward pass for softmax activation.

        Parameters
        ----------
        Z   input to `forward` method
        dY  derivative of loss w.r.t. the output of this layer
            same shape as `Z`

        Returns
        -------
        derivative of loss w.r.t. input of this layer
        """
        ### YOUR CODE HERE ###
        forward = self.forward(Z)
        answer = np.zeros_like(Z)
        for i in range(np.shape(Z)[0]):
            data =  forward[i]
            outer = np.multiply(-1, np.outer(data, data))
            diagonal = np.diag(outer)
            diagonal= np.multiply(-1, diagonal)
            diagonal = np.sqrt(diagonal)
            diagonal = np.diag(diagonal)
            jacobian = diagonal + outer
            answer[i] = dY[i] @ jacobian
        return answer
```

0.0.2 Layer Implementations:

Implementation of `layers.FullyConnected`:

```
class FullyConnected(Layer):
    """A fully-connected layer multiplies its input by a weight matrix, adds
    a bias, and then applies an activation function.
    """

    def __init__(
        self, n_out: int, activation: str, weight_init="xavier_uniform"
    ) -> None:

        super().__init__()
```

```python
        self.n_in = None
        self.n_out = n_out
        self.activation = initialize_activation(activation)

        # instantiate the weight initializer
        self.init_weights = initialize_weights(weight_init, activation=activation)

    def _init_parameters(self, X_shape: Tuple[int, int]) -> None:
        """Initialize all layer parameters (weights, biases)."""

0.0.3 Loss Function Implementations:

Implementation of `losses.CrossEntropy`:

```python
class CrossEntropy(Loss):
    """Cross entropy loss function."""

    def __init__(self, name: str) -> None:
        self.name = name

    def __call__(self, Y: np.ndarray, Y_hat: np.ndarray) -> float:
        return self.forward(Y, Y_hat)

    def forward(self, Y: np.ndarray, Y_hat: np.ndarray) -> float:
        """Computes the loss for predictions `Y_hat` given one-hot encoded labels
        `Y`.

        Parameters
        ----------
        Y      one-hot encoded labels of shape (batch_size, num_classes)
        Y_hat  model predictions in range (0, 1) of shape (batch_size, num_classes)

        Returns
        -------
        a single float representing the loss
        """

        ### YOUR CODE HERE ###
        losses = Y * np.log(Y_hat)
        sum_losses = -np.sum(losses)
        answer = sum_losses / np.shape(Y)[0]
        return answer

    def backward(self, Y: np.ndarray, Y_hat: np.ndarray) -> np.ndarray:
        """Backward pass of cross-entropy loss.
        NOTE: This is correct ONLY when the loss function is SoftMax.

        Parameters
        ----------
        Y      one-hot encoded labels of shape (batch_size, num_classes)
        Y_hat  model predictions in range (0, 1) of shape (batch_size, num_classes)

        Returns
        -------
        the derivative of the cross-entropy loss with respect to the vector of
        predictions, `Y_hat`
```

```python
        """
        ### YOUR CODE HERE ###
        vector = np.multiply(-1, np.divide(Y, Y_hat))
        answer = np.divide(vector, np.shape(Y)[0])
        return answer
```

Implementation of `losses.L2`:

```python
class L2(Loss):
    """Mean squared error loss."""

    def __init__(self, name: str) -> None:
        self.name = name

    def __call__(self, Y: np.ndarray, Y_hat: np.ndarray) -> float:
        return self.forward(Y, Y_hat)

    def forward(self, Y: np.ndarray, Y_hat: np.ndarray) -> float:
        """Compute the mean squared error loss for predictions `Y_hat` given
        regression targets `Y`.

        Parameters
        ----------
        Y      vector of regression targets of shape (batch_size, 1)
        Y_hat  vector of predictions of shape (batch_size, 1)

        Returns
        -------
        a single float representing the loss
        """
        ### YOUR CODE HERE ###
        return ...

    def backward(self, Y: np.ndarray, Y_hat: np.ndarray) -> np.ndarray:
        """Backward pass for mean squared error loss.

        Parameters
        ----------
        Y      vector of regression targets of shape (batch_size, 1)
        Y_hat  vector of predictions of shape (batch_size, 1)

        Returns
        -------
        the derivative of the mean squared error with respect to the last layer
        of the neural network
        """
        ### YOUR CODE HERE ###
        return ...
```

0.0.4 Model Implementations:

Implementation of `models.NeuralNetwork.forward`:

```python
def forward(self, X: np.ndarray) -> np.ndarray:
    """One forward pass through all the layers of the neural network.

    Parameters
    ----------
    X  design matrix whose must match the input shape required by the
       first layer

    Returns
    -------
    forward pass output, matches the shape of the output of the last layer
    """
    ### YOUR CODE HERE ###
    # Iterate through the network's layers.
    for layer in self.layers:
        X = layer.forward(X)
    return X
```

Implementation of `models.NeuralNetwork.backward`:

```python
def backward(self, target: np.ndarray, out: np.ndarray) -> float:
    """One backward pass through all the layers of the neural network.
    During this phase we calculate the gradients of the loss with respect to
    each of the parameters of the entire neural network. Most of the heavy
    lifting is done by the `backward` methods of the layers, so this method
    should be relatively simple. Also make sure to compute the loss in this
    method and NOT in `self.forward`.

    Note: Both input arrays have the same shape.

    Parameters
    ----------
    target  the targets we are trying to fit to (e.g., training labels)
    out     the predictions of the model on training data

    Returns
    -------
    the loss of the model given the training inputs and targets
    """
    ### YOUR CODE HERE ###
    # Compute the loss.
    # Backpropagate through the network's layers.
    curr_loss = self.loss.forward(target, out)
    derivative = self.loss.backward(target, out)
    backwards = self.layers[::-1]
```

```python
        for layer in backwards:
            derivative = layer.backward(derivative)
        return curr_loss
```

Implementation of `models.NeuralNetwork.predict`:

```python
    def predict(self, X: np.ndarray, Y: np.ndarray) -> Tuple[np.ndarray, float]:
        """Make a forward and backward pass to calculate the predictions and
        loss of the neural network on the given data.

        Parameters
        ----------
        X  input features
        Y  targets (same length as `X`)

        Returns
        -------
        a tuple of the prediction and loss
        """
        ### YOUR CODE HERE ###
        # Do a forward pass. Maybe use a function you already wrote?
        # Get the loss. Remember that the `backward` function returns the loss.
        answer = self.forward(X)
        loss = self.backward(Y, answer)
        return (answer, loss)
```
